## Thanks for choosing AMain Hobbies!

Here's what you get when you shop with us. Along with the best products in the industry, everything you need to win, an easy-to-use website... well, you get the idea.

Same day shipping on most orders.  
Plus, orders over \$99 ship for free\*.

90% of domestic orders are  
delivered within 3 business days.

Technical help and support from  
a team of top-notch reps.

Spendable rewards points,  
extra time for returns,  
and VIP-only discounts. All for free.

### EASY RETURNS

# How to Make a Faster Race Car

A quick tip on how to make your stock buggy or truck go faster.

In stock racing, it can be hard to get an edge over the competition. Everyone in each class is running a motor of the same speed, with the same battery voltage. So how can you add some extra speed to your car? Two go-to methods are reducing weight, and decreasing rolling resistance.

The lighter your car, the faster your motor can make it go. In stock racing classes there is a minimum weight that you can't go under. But getting closer to it will help you gain some speed. The most efficient way to reduce weight is to replace parts with lighter parts.

Replacing steel hardware with titanium and aluminum hardware can save a few grams here and there, which adds up. Replacing steel driveline parts like outdrives with aluminum not only reduces overall weight but also reduces the load on the motor. This means the motor doesn't have to work as hard and increases the efficiency of your RC.

Another place you can drop weight is by using a low-profile servo. Low-profile servos are slightly shorter than standard servos, and therefore lighter. They're great options for most 1/10 stock classes. While we're on electronics, you can try a lighter fan. A plastic fan will be a few grams lighter than an aluminum fan, and as we've mentioned, those grams add up.

To top all of this off, you can replace stock bearings with ceramic bearings. While more expensive than metal bearings, they significantly decrease rolling resistance and help you take advantage of the newly reduced weight. You can find ceramic bearing kits by J&T Bearing Co. and Whitz Racing Products.

Of course, there are endless upgrades you can make to your ride, some more effective than others. That's part of the fun of RC! We hope you found this quick tip helpful! For more on this, check out the video on our YouTube channel!

# How to Build & Break in a Ball Differential

with Team Associated's Spencer Rivkin

Having a dialed differential is a vital aspect of any race program. Your differential affects how much power your car is able to put down, your traction, and the overall handling of your RC. So we got a few tips from 2019 2WD 1/10 IFMAR World Champion and Team Associated's Spencer Rivkin.

## Building

When building a ball diff, the grease (and how much of it) you use is very important. Spencer recommends RM2 brand grease from JConcepts. Black [JC08119] for the thrust bearing assembly, and clear [JC08118] for the diff rings and outdrives, and inside the diff itself. It's best to use a liberal amount on all sides and wipe away excess when you're complete

When building the thrust assembly he recommends using a caged thrust bearing, like the one from ProTek RC [PTK-2026]. These are easier to build, run smoother, and last longer than loose-ball thrust bearings.

Before you begin assembling the differential itself, Spencer likes to clean the diff rings and outdrives with a motor spray or degreaser to eliminate any residue left over from manufacturing. Then, when putting it all together remember to use a healthy amount of grease. After it's together you can work it in by hand a little bit to make sure everything moves freely and stays together. To make sure the thrust bolt is tight enough, you can pull the outdrives apart from each other - if you feel any play it should be tighter.

## Break In

Once you install the differential into your kit you can begin the break in. Spencer does this by putting the buggy on a stand and running it slowly with one outdrive or wheel held in place. This forces the diff to spin and begin breaking in. Start slowly and do each side for 20-30 seconds before stopping and tightening the thrust bolt. Repeat this process 3-5 times as necessary until the thrust bolt stays nice and tight, and the diff action is where you like it.

Now get out there and race!

For a more detailed video explanation check out Spencer's YouTube channel.

# A WORD WITH ROBIN SCHUMACHER

We had the opportunity to catch up with Robin Schumacher, a British manufacturer and very much a pioneer in carpet specific cars and tires (or tyres if you ask Robin). British racers have long enjoyed the higher levels of grip and cleaner, lower maintenance of the cars carpet delivers and there is no denying that the same benefits being realized in the UK are now being seen in the US. With the rise in popularity, here's what Robin shared for our customers new to this form of racing.

## What can you tell us about choosing the right tire for the surface of the track?

Choosing the right tire is probably the most important part of carpet car set up to get right. Smooth clean surfaces require a maximum amount of rubber to be in contact with the track and as with a clay track, a slick tire is going to be best. When water is present on the surface then treaded tires help to move the water out of the way. Generally speaking, some form of spikes or pins are going to provide you the best performance on carpet or Astroturf and choosing the right one is dictated by the "pile" of the carpet or turf.

### Spikes or Pins?

A longer pile, more shag if you will, requires an adequate spike to dig into the fibres. More recently, tracks are installing shorter pile Astroturf for which a tire that has smaller pins would be the choice for most racers. Carpet tires require much shorter spikes and these are commonly referred to as pins. A pin differs from a spike in the shape and density of the tread. Pins are smaller, more pointed lugs and have noticeably more pins and points of contact around the tire. The Schumacher Minispike and Mini Dart are popular Astroturf tires.

## Compounds are in important consideration in dirt racing, what about turf and carpet?

Choosing the right rubber compound is just as important here, but is less specific about the surface itself and more about conditions. Our 'Yellow' compound is our medium compound and the most widely used for dry weather racing on both Astroturf and carpet. The much softer 'Silver' compound works well in wet conditions, and the harder 'Blue' is a long wear compound.

## We notice that a lot of the carpet tires have a higher profile, why is that?

A high profile tire simply rides the bumps better. The sidewall flexes and acts like an additional shock absorber which is important for tracks built on hard surfaces. The down side is that the sidewall will also flex as the car changes direction making it less responsive and more prone to traction roll. But just like dirt racing, there is a tire or a set up change for every surface and condition. The latest tracks are relatively smooth and the improved responsiveness and driving feel of the low profile tire outweigh the reduced bump handling.

## We notice that you don't include closed cell inserts as we typically see in the US, why is that?

Different inserts change the characteristics of the tire. If a spike bends over, the traction is ruined so carpet and Astro tires are made from relatively firm rubber to give strength and support to the spikes. Since the rubber is firm, the best support for this rubber and tread is a softer, open cell insert. On the contrary, dirt tires, are commonly made from a softer rubber and require a firmer insert such as a moulded, or closed cell insert to give the tire support.

**Thanks Robin!**

The 2023 1/10 IFMAR World Championships saw ProTek RC batteries on the podium three times!

Congrats to Tater Sontag who took first in 2WD and Team Associated's Spencer Rivkin who took second in both 4WD and 2WD running ProTek RC 2S LiHV shorty packs!
